

Runbook: ServiceNow ↔ Jira Incident Sync Failure

Field	Value
System	ITSM (ServiceNow + Jira Service Management)
Category	Integration / Incident Management
Error Code	ITSM-BRIDGE-404
Severity	P3
Last Updated	2026-07-08
Owner	FinOps L2 — ITSM & Tooling

Symptoms

- Incident created in ServiceNow does not appear as linked issue in Jira Service Management within 5 minutes.
- Jira ticket shows stale status while ServiceNow incident was resolved hours ago.
- Integration log: ITSM-BRIDGE-404: Target issue key not found — JIRA-PROJ-99999.
- Analysts duplicate work because status is inconsistent across tools.

Root Causes (Known)

- Jira issue deleted or moved to different project — bridge still references old key.
- ServiceNow integration user account locked or API token expired.
- Field mapping mismatch — mandatory Jira field Component not populated from ServiceNow category.
- Webhook queue backlog on ServiceNow MID server.

Prerequisites

- ServiceNow `incident` table read/write (role: `itil` or integration support).
- Jira project permissions for FINOPS support project.
- Incident number (INC) and Jira issue key (FINOPS-).

Resolution Steps

Step 1 — Locate both records

1. ServiceNow: search incident by number INC0012345.
2. Check field `u_jira_issue_key` (or correlation display field).
3. Jira: search issue key from ServiceNow — confirm it exists and is not archived.

Step 2 — Repair broken link

1. If Jira issue missing: create new Jira ticket from ServiceNow via **Create Linked Issue** button on incident form.
2. Copy summary, description, priority, and affected CI from ServiceNow.
3. Update ServiceNow field `u_jira_issue_key` with new Jira key.

Step 3 — Force sync (status update)

1. ServiceNow → **Related Links** → **Resync to Jira**.
2. Or run script include: `FinOpsJiraSync.resyncIncident(incidentSysId)` (admin only).
3. Verify Jira comment appears: "Sync from ServiceNow INC0012345 — status: Resolved."

Step 4 — Fix field mapping errors

1. Check integration error table: `u_integration_log` filtered by ITSM-BRIDGE-404.
2. If Component missing: map ServiceNow **Category** to Jira **Component** in integration config.
3. Reprocess failed events from **Integration Error Inbox**.

Step 5 — Token / credential refresh

1. If HTTP 401 in logs: rotate Jira API token for integration user `svc-finops-jira`.
2. Update credential record in ServiceNow **Connections & Credentials** alias `finops_jira_prod`.
3. Test with **Test Connection** before bulk reprocess.

Rollback

- Unlink incorrect Jira issue from ServiceNow incident via **Remove Correlation** — does not delete either record.

Verification

- Jira issue status matches ServiceNow incident state mapping table.
- Bi-directional comment test: add internal note in Jira → appears in ServiceNow within 2 minutes.
- Integration error inbox empty for that incident.

Escalation

- MID server queue depth > 1000: **ServiceNow platform team**.
- Mass sync failure (> 50 incidents): open **Problem** record — do not manual sync one-by-one.
