

Runbook: CRM Customer Master Sync Failure

Field	Value
System	CRM
Category	Integration / Master Data
Error Code	CRM-SYNC-901
Severity	P2
Last Updated	2026-07-01
Owner	FinOps L2 — CRM & Integration

Symptoms

- New or updated customers in ERP do not appear in CRM within expected 15-minute sync window.
- CRM integration dashboard shows failed jobs with error `CRM-SYNC-901: Duplicate external ID conflict`.
- Salesforce (or Dynamics) Data Loader job report lists `DUPLICATE_VALUE` on field `External_Customer_ID__c`.
- Support tickets report: "Customer exists in billing but not in CRM — cannot create opportunity."

Root Causes (Known)

1. Duplicate `External_Customer_ID__c` — same ERP customer number mapped to two CRM records.
2. CRM API rate limit exceeded during bulk sync (10,000+ records).
3. Invalid character in customer name or address failing CRM validation rules.
4. Integration service account token expired (OAuth refresh failure).

Prerequisites

- CRM admin or integration support role.
- Access to integration middleware logs (MuleSoft / Dell Boomi / custom `crm-sync-service`).
- ERP customer number (KUNNR / Customer Account Number).

Resolution Steps

Step 1 — Identify failed record

1. Open integration monitor: <https://integrations.internal/crm-sync/dashboard>.
2. Filter failures by error code `CRM-SYNC-901` in last 24 hours.
3. Export failed record list — note `externalCustomerId`, `crmRecordId`, `errorDetail`.

Step 2 — Resolve duplicate external ID

1. In CRM, search `External_Customer_ID__c = {ERP customer number}`.
2. If two records found:
 - Identify **golden record** (most recent activity, valid tax ID).
 - Merge duplicate into golden record using CRM **Merge** tool.
 - Ensure merged record retains correct `External_Customer_ID__c`.
3. Mark orphan record as inactive — do not delete (audit requirement).

Step 3 — Re-trigger sync for single customer

1. Integration dashboard → **Manual Sync**.
2. Enter ERP customer number and direction: `ERP → CRM`.
3. Run sync and verify job status `SUCCESS`.

Step 4 — Bulk catch-up (if many failures)

1. Check OAuth token expiry on integration service.
2. If token expired: restart `crm-sync-service` and refresh credentials in vault.
3. Run **Delta Sync** for last 24 hours only — avoid full reload.

Step 5 — Validate validation rule failures

1. For errors containing `FIELD_CUSTOM_VALIDATION_EXCEPTION`, open failed payload in logs.
2. Common fix: trim special characters from `BillingStreet` or correct invalid VAT format.
3. Correct data in ERP master (transaction `XD02`), then re-sync.

Rollback

- Undo merge in CRM only via **Recycle Bin** within 15 days if wrong records merged.
- Do not run full CRM reload without Change Advisory Board approval.

Verification

- Customer visible in CRM with matching ERP customer number.
- Integration dashboard shows 0 pending failures for that external ID.
- Test create Opportunity on customer — no master data errors.

Escalation

- OAuth / credential issues: **Identity / IAM team**.
- Persistent rate limit errors: **CRM Platform team** — request temporary limit increase.
