

Runbook: ERP Payment Interface Timeout (PI-1234)

Field	Value
System	ERP
Category	Payments / Interface
Error Code	PI-1234
Severity	P2
Last Updated	2026-07-15
Owner	FinOps L2 — Payments Team

Symptoms

- Outbound payment batch job `PAY_IF_OUT_001` fails or times out after 120 seconds.
- Application log shows: `PI-1234: Payment gateway handshake timeout – host payment-gw-prod-01`.
- SAP FI payment run completes partially; some line items remain in status `TRANSFER_PENDING`.
- Users report payments stuck in "Awaiting Bank Confirmation" in the ERP payment monitor (transaction `F110`).

Root Causes (Known)

- Payment gateway certificate expired or TLS mismatch.
- Network firewall rule blocking port 443 between ERP app server and gateway.
- Gateway rate limit exceeded during month-end batch window.
- Stale connection pool on ERP middleware (PI/PO or custom adapter).

Prerequisites

- Access to ERP transaction `SM59` (RFC destinations) or payment adapter admin console.
- VPN access to production payment zone.
- Change ticket required for firewall or certificate changes.

Resolution Steps

Step 1 — Confirm the error

1. Open payment interface log: `/var/log/erp/payment-interface.log` (Linux) or Event Viewer → Application → `ERP.PaymentGateway`.
2. Search for `PI-1234` and note the timestamp and correlation ID (format: `PAY-YYYYMMDD-NNNNN`).
3. Check gateway health dashboard: <https://monitor.internal/payment-gateway/status>.

Step 2 — Test connectivity

1. From ERP app server, run: `curl -v --connect-timeout 10 https://payment-gw-prod-01.internal/health`
2. Expected response: HTTP 200 with body `{"status": "UP"}`.
3. If connection refused or timeout, escalate to Network team with source IP of ERP app server.

Step 3 — Restart payment adapter (safe first action)

1. Stop adapter service: `systemctl stop erp-payment-adapter`
2. Wait 30 seconds.
3. Start adapter: `systemctl start erp-payment-adapter`
4. Re-run a **single test payment** (amount ≤ 1.00 EUR) via transaction `F110` in test mode.

Step 4 — Reprocess failed payments

1. In transaction `F110`, filter documents with status `TRANSFER_PENDING`.
2. Select failed items from the same batch (match correlation ID).
3. Execute **Restart Transfer** — do not create duplicate payment records.
4. Verify status changes to `TRANSFER_COMPLETE` within 5 minutes.

Rollback

- If test payment duplicates, reverse via transaction `FBRA` using document number from step 3.
- Do not mass-reprocess until one test payment succeeds.

Verification

- All items in batch show status `TRANSFER_COMPLETE`.
- No new `PI-1234` entries in logs for 15 minutes after reprocessing.
- Payment gateway dashboard shows successful handshake from ERP source IP.

Escalation

- If error persists after adapter restart: escalate to **Payments L3** and attach correlation ID.

- If certificate error in logs (SSL handshake failed): escalate to **Security / PKI team**.
